Task 1: Prompt Engineering Experiments

In this experiment, we compare different prompt engineering strategies for handling the same ticket

The goal is to determine which prompt produces the best response

Prompt	Result
Basic	Correct but too short
Role-Based	More professional and detailed
Strict RAG	Best overall

Conclusion:

The experiments showed that more detailed and structured prompts produced better responses.

Task 2: Chunking Strategy Experiments

In this experiment, we compare different chunk sizes and overlap values
.to evaluate their effect on semantic retrieval

Strategy	Chunk	Size	Overlap	Result
A		500	100	Best
B		1000	200	Lower retrieval performance

Conclusion:

The experiments showed that smaller chunks performed better for this telecom knowledge base. The 500-character chunks with 100-character overlap consistently produced better retrieval results than the 1000-character chunks with 200-character overlap across the tested .queries. This suggests that smaller chunks provided more focused and relevant context
